

transluzente Compositepaneele

Bencore takes advantage of the most innovative technologies and manufacturing patents to make, in Italy, composite thermosresins with honeycomb structure, putting together 4 elements: lightweight, translucency, rigidity and design. Bencore stands for composite translucent panels and transparent panels for architecture and interior design. Translucency, color, stiffness, beauty and technology are the main features of Bencore products line. Bencore offers to architects and designers a wide collection to play with when working on partition walls, doors, tables, back-ceiling, raised floor and anything that can be made with a composite panel. In Bencore the innovation process is constant and each product is a starting-point for new developments: Eco-ben Wave and Lightben Acoustic are the latest answers to market's requests.

Bencore is an innovative, technological and sustainable brand. Bencore has worked for years to create eco-sustainable products in full respect of the environment. Many products are made of recycled raw materials. Eco-ben core is made of fully recycled cardboard honeycomb that can be combined with Greencast acrylic to make a fully recycled composite panel.

At the end of their life cycle, Bencore panels can be recycled again, separating different materials like polycarbonate, petg, acrylic, aluminum. Bencore panels can also be easily re-used in interior application: partition can be re installed in different shapes, can become tables or shelves or interior design products. The fact that Bencore panels combine flexural strength with light weight, is another step towards sustainability. Shipping lighter materials produces less pollution. Light transmission, transparency, translucency allows less use of artificial light in all partition, ceiling and floor application.
