

We provide support throughout the entire process, from the manufacture of sound absorbers, acoustic planning including expert reports, factory and installation planning through to construction. This enables us to minimise the interfaces between the various trades and provide you with expert advice for your upcoming projects.

The PET absorbers on display here are our Soft-Line absorbers, which consist of 60% recycled material. Our Solid-Line product range has an internal wooden frame that is covered with fabric. This provides more stability in areas subject to heavy use, e.g. schools, nurseries and corridors. The inlay can be selected from: PET, rock wool as A2 material or hemp. Both the Soft-Line and Solid-Line products can be tailored to your requirements in terms of thickness, colour, edge, fabric covering and shape.

Our other product portfolio includes: steel and aluminium wall and ceiling cladding; acoustic and soundproof curtains; moss pictures and walls; wooden wall and ceiling cladding.
