

Hessler lime plasters stand for sustainable and aesthetically pleasing interior and exterior surfaces. Thanks to their high alkalinity, they have a natural anti-mould effect and regulate moisture by absorbing and releasing water vapour. This promotes a healthy indoor climate and protects building fabric in the long term.

The special crystalline structure of pure lime ensures an unmistakable, lively look with iridescent light reflections and a soft feel. Whether matt, cloudy or polished - lime plaster offers a wide range of design options that integrate harmoniously into both modern and historical architecture.

Hessler relies on pure lime products with lime (NHL) as the sole binding agent - without the addition of cement, (FGD) gypsum or synthetic additives, which guarantees the highest building biology quality. The durability of lime systems reduces refurbishment costs and maintains aesthetic value for decades. Ideal for architects who want to combine sustainability with timeless elegance.
