

The core of a straw building board consists of highly compressed straw, without any other binding agents. A hydrophobised recycled cardboard is laminated around this core, which can be finished with all standard top coats. Our straw building boards are the perfect solution for your drywall construction. They are easy to work with and very stable, meaning that dowels are no longer required. Any standard surface can be realised with them and the sound insulation is very good. In the attic, they also offer very good heat insulation.

Blow-in insulation is a quick, cost-effective and stable way of installing insulation materials. In addition, they are extremely economical, as there are no waste cuttings and the quantities can be calculated very accurately. istraw.blow is currently the most efficient pure blow-in insulation on the market.

istraw.mdf are bonded emission-free and therefore a direct benefit for the indoor climate. The exceptionally stable boards are suitable for high-quality furniture construction as well as for robust use in structural and interior work. Thanks to their natural composition, they ensure a pleasant indoor climate and offer a sustainable alternative to conventional MDF - without harmful emissions.
